Networx NX-584 RS-232 Gateway Interface Protocol

Revised April 3, 2000

This document will describe the electrical connections, handshaking, format options and message structure for the NX-584 RS-232 Gateway interface expansion module.

The NX-584 consists of an expansion card that conforms to the NX series card guide form factor and includes all of the necessary hardware for mounting inside any NX enclosure. It has a three position terminal strip for buss connection to the NX master control. A male DB-9 connector is also located on the card that contains all of the necessary RS-232 signals.

DB-9 Pin-out				
Signal Name	Direction NX------PC	Jumper Number	Pin Number	
			A Position	B Position
Cts*	⟶	J7	8**	7
Txd	⟶	J8	2	3**
Rts*	⟵	J9	8	7**
Rxd	⟵	J10	2**	3
Sig.Gnd.	⟷	--	5	
Unused	--	--	1,4,6,9	

**Note: Rts and Cts signals are not currently supported.*
***Note: Default jumper settings.*

Byte format:

The byte format for all methods and speeds of this interface will be:

1 start bit, 8 bit data, no parity, and 1 stop bit.

Length byte:

The Length byte will always follow the Start character in both the ASCII and Binary formats. The Length byte will be a hexadecimal value that is a count of all bytes that follow, with the exception of stuffed bytes (binary only), checksum bytes, and Stop characters (ASCII only). (The 'Summary of Messages' table will contain the proper length associated with each message.)

Message type byte:

The Message type byte consists of a 6-bit (bits 0-5) value that represents the Message Number and two flag bits (bits 6&7). The Bit 6 flag is reserved at this time. Bit 7 in the Message type byte is used as an Acknowledge Required flag. When the Acknowledge Required flag is set, the message must be acknowledged or the same message will be repeated. This unacknowledged condition will be considered as an Implied Negative Acknowledge. Any message that is sent with the Acknowledge Required flag being clear, should not be acknowledged! In practice all messages that are polled (request and reply) will not set the Acknowledge Required flag, it will be assumed that the message was received correctly when a valid reply is returned. Any messages that are sent due to changes or transitions will set the Acknowledge Required flag to insure that the message was received properly. Also, any messages that contain a command that does not have a specific reply should set the Acknowledge Required flag.

Checksum:

All numeric information relating to either ASCII or Binary formats will be in Hexadecimal. Both formats use a 16-bit Fletcher Checksum. The following Pseudo-code describes how the Fletcher Checksum is calculated. The bytes that are used to calculate the checksum include the Length byte and all message/data/command bytes. It will not include any Start character, stuffed bytes (Binary version) or Stop characters (ASCII version).

Fletcher Checksum using 8-bit math:

(Sum1 and Sum2 are unsigned 8-bit integers)

```
Sum1, Sum2 = 0
for I = 1 to len (string)
        if (255 - Sum1) < string(I) then
                Sum1 = Sum1 + 1
        end if
        Sum1 = Sum1 + string(I)
        if Sum1 = 255 then
                Sum1 = 0
        end if
        if (255 - Sum2) < Sum1 then
                Sum2 = Sum2 + 1
        end if
        Sum2 = Sum2 + Sum1
        if Sum2 = 255 then
                Sum2 = 0
        end if
next I
```

ASCII Version format:

The ASCII Version format will consist of a Start character, a Length (byte pair), a Message type (byte pair), any Data (byte pair(s)), Fletcher Checksum (four byte pairs), and a stop byte. With the exception of the Start and Stop bytes, all information will be sent as two ASCII characters that form a data byte. The only valid characters that may be used to form a data byte pair is, 0-9 (30h-39h) and capital A-F (41h-46h). Any other character received in the body of a message would invalidate the entire message. The Start character will be an ASCII Line Feed (0Ah), and the Stop character will be a Carriage Return (0Dh).

This is an example of an ASCII Zone Status message (acknowledge required):

	Start character	Message length		Message number		Zone number		Partition mask		Type flags 1		Type flags 2		Condition flags 1		Condition flags 2		Fletcher sum 1		Fletcher sum 2		Stop character
Hex	0Ah	07h		84h		09h		7Eh		10h		58h		01h		00h		7Ch		D1h		0Dh
Sum1	-	07h		8Bh		94h		13h		23h		7Bh		7Ch		7Ch		-		-		-
Sum2	-	07h		92h		27h		3Ah		5Dh		D8h		55h		D1h		-		-		-
Sent ASCII	LF	0	7	8	4	0	9	7	E	1	0	5	8	0	1	0	0	7	C	D	1	CR

The Sum1 and Sum2 values are shown as each byte is processed, only the final values are used in the message.

Binary Version format:

The Binary Version format will consist of a Start character, a Length byte, a Message type byte, any data bytes, and a two byte Fletcher Checksum. This format will not send any Stop character. The Start character will always be a 7Eh. Whenever a 7Eh is encountered in a stream of data, it should be used as the start of a new message. In order to allow for the value of 7Eh to be used in the message, Byte Stuffing must be used. Byte stuffing will substitute the two-byte sequence, 7Dh, 5Eh in place of a 7Eh data byte. It will also be necessary to use the two-byte sequence, 7Dh, 5Dh in place of the 7Dh data byte. The receiver will remove all 7Dh's from the incoming message and exclusive or the following byte with 20h in order to recover the original data byte. Both the Length byte and Fletcher Checksum will use the un-stuffed (recovered) message for calculations.

This is an example of an Binary Zone Status message (acknowledge required):

	Start character	Message length	Message number	Zone number	Partition mask		Type flags 1	Type flags 2	Condition flags 1	Condition flags 2	Fletcher sum 1	Fletcher sum 2
Hex	7Eh	07h	84h	09h	7Eh		10h	58h	01h	00h	7Ch	D1h
Sum1	-	07h	8Bh	94h	13h		23h	7Bh	7Ch	7Ch	-	-
Sum2	-	07h	92h	27h	3Ah		5Dh	D8h	55h	D1h	-	-
Sent Binary	7Eh	07h	84h	09h	7Dh	5Eh	10h	58h	01h	00h	7Ch	D1h

The Sum1 and Sum2 values are shown as each byte is processed, only the final values are used in the message.

Special Operational Notes:

Both this interface itself and the device it is connected to, must acknowledge any message that is formatted correctly with the Acknowledge Required flag set. That is to say, the start character was correct, the length was correct and the checksum was correct. In practice, if a message is properly formatted, but is not recognized, the Message Reject (1Fh) should be sent back as the reply. This will keep the port from locking up when unsupported messages/command/requests are passed.

Summary of Messages

Message Number	Message Name	Message Length**	Transition Capable	Acknowledged
00h	**Do not use**	**-**	**-**	**-**
01h	**Interface Configuration Message**	**11**		**Possible**
02h	**Reserved**	**-**		**-**
03h	**Zone Name Message**	**18**		**No**
04h	**Zone Status Message**	**8**	**Yes**	**Possible**
05h	**Zones Snapshot Message**	**10**	**Yes**	**Possible**

Message number: **0Bh**

Message name: **Keypad Message Received**

Message length: **3 Bytes**

Acknowledged: **Yes**

Description: This message contains a keystroke from a keypad that is in a Terminal Mode.

Byte 1	**Message number**	**Byte 3**	**Key value**
Byte 2	**Keypad address**		

Key value	Key pressed	Key value	Key pressed
00H	Terminal mode '0' key	0BH	Terminal mode 'Chime' key
01H	Terminal mode '1' key	0CH	Terminal mode 'Exit' key
02H	Terminal mode '2' key	0DH	Terminal mode 'Bypass' key
03H	Terminal mode '3' key	0EH	Terminal mode 'Cancel' key
04H	Terminal mode '4' key	0FH	Terminal mode 'Fire' key
05H	Terminal mode '5' key	10H	Terminal mode 'Medic' key
06H	Terminal mode '6' key	11H	Terminal mode 'Police' key
07H	Terminal mode '7' key	12H	Terminal mode '*' key
08H	Terminal mode '8' key	13H	Terminal mode '#' key
09H	Terminal mode '9' key	14H	Terminal mode 'Up' key
0AH	Terminal mode 'Stay' key	15H	Terminal mode 'Down' key

Message number: **10h**

Message name: **Program Data Reply**

Message length: **13 Bytes**

Acknowledged: **Yes**

Description: This message will contain a system device's buss address, logical location, and program data that was previously requested (via Program Data Request (3Ch)).

Byte 1	**Message number**			**Byte 6**	**Data byte**
Byte 2	**Device's buss address**			**Byte 7**	**Data byte**
Byte 3	**Upper logical location / offset**			**Byte 8**	**Data byte**
Bits 0-3	Bits 8-11 of logical location			**Byte 9**	**Data byte**
Bit 4	Segment size (0=byte, 1=nibble)			**Byte 10**	**Data byte**
Bit 5	Must be 0			**Byte 11**	**Data byte**
Bit 6	Segment offset (0-none, 1=8 bytes)			**Byte 12**	**Data byte**
Bit 7	Must be 0			**Byte 13**	**Data byte**
Byte 4	**Bits 0-7 of logical location**				
Byte 5	**Location length / data type**				
Bits 0-4	Number of segments in location (0=1 segment)				
Bits 5-7	Data type :	2=Hexadecimal	5=unused		
	0=Binary	3=ASCII	6=unused		
	1=Decimal	4=unused	7=unused		

Message number: **12h**
Message name: **User Information Reply**
Message length: **7 Bytes**
Acknowledged: **No**
Description: This message will contain all digits, attributes and partitions for the requested user PIN number that was previously requested (via User Information Request with(out) PIN (32h,33h)).

Byte 1	**Message number**	**Byte 6***	**Authority flags** (if bit 7 is set)
Byte 2	**User Number** (1=user 1)	Bit 0	Output 1 enable
Byte 3	**PIN digits 1 & 2**	Bit 1	Output 2 enable
Bits 0-3	PIN digit 1	Bit 2	Output 3 enable
Bits 4-7	PIN digit 2	Bit 3	Output 4 enable
Byte 4	**PIN digits 3 & 4**	Bit 4	Arm / disarm
Bits 0-3	PIN digit 3	Bit 5	Bypass enable
Bits 4-7	PIN digit 4	Bit 6	Open / close report enable
Byte 5	**PIN digits 5 & 6**	Bit 7	Must be a 1
Bits 0-3	PIN digit 5 (pad with 0 if 4 digit PIN)	**Byte 7**	**Authorized partition(s) mask**
Bits 4-7	PIN digit 6 (pad with 0 if 4 digit PIN)	Bit 0	Authorized for partition 1
Byte 6*	**Authority flags** (if bit 7 is clear)	Bit 1	Authorized for partition 2
Bit 0	Reserved	Bit 2	Authorized for partition 3
Bit 1	Arm only	Bit 3	Authorized for partition 4
Bit 2	Arm only (during close window)	Bit 4	Authorized for partition 5
Bit 3	Master / program	Bit 5	Authorized for partition 6
Bit 4	Arm / disarm	Bit 6	Authorized for partition 7
Bit 5	Bypass enable	Bit 7	Authorized for partition 8
Bit 6	Open / close report enable		
Bit 7	Must be a 0		

Message number: **1Ch**
Message name: **Command / Request Failed**
Message length: **1 Byte**
Acknowledged: **No**
Description: This message is sent in place of a 'Positive Acknowledge' message when a command or request was received properly, but the system was unable to carry out the task correctly. This would normally occur 2.5 seconds after receiving the initial command or request.

Byte 1	**Message number**		

Message number: **1Dh**
Message name: **Positive Acknowledge**
Message length: **1 Byte**
Acknowledged: **No**
Description: This message will acknowledge receipt of a message that had the 'Acknowledge Required' flag set in the command byte.

Byte 1	**Message number**		

Message number: 1Eh
Message name: **Negative Acknowledge**
Message length: **1 Byte**
Acknowledged: **No**
Description: This message is sent in place of a ‘Positive Acknowledge’ message when the message received was not properly formatted. It will also be sent if an additional message is received before a reply has been returned during the 2.5 second allowable reply period of a previous message. An ‘Implied Negative Acknowledge’ is assumed when no acknowledge is returned with 3 seconds.

Byte 1	**Message number**		

Message number: **1Fh**
Message name: Message Rejected
Message length: **1 Byte**
Acknowledged: **No**
Description: This message is sent in place of a ‘Positive Acknowledge’ message when the message was received properly formatted, but not supported or disabled.

Byte 1	**Message number**		

Message number: **21h**
Message name: **Interface Configuration Message**
Message length: **1 Byte**
Acknowledged: **No**
Description: This request will cause the return of the Interface Configuration Message (01h) containing information about the options selected on the interface.

Byte 1	**Message number**		

Message number: **23h**
Message name: **Zone Name Request**
Message length: **2 Bytes**
Acknowledged: **No**
Description: This request will cause the return of the Zone Name Message (03h) for the zone number that was requested.

Byte 1	**Message number**	**Byte 2**	**Zone number (0= zone 1)**

Message number: **24h**
Message name: **Zone Status Request**
Message length: **2 Bytes**
Acknowledged: **No**
Description: This request will cause the return of the Zone Status Message (04h) for the zone number that was requested.

Byte 1	**Message number**	**Byte 2**	**Zone number (0= zone 1)**

Message number: **25h**
Message name: **Zones Snapshot Request**
Message length: **2 Bytes**
Acknowledged: **No**
Description: This request will cause the return of the Zones Snapshot Message (05h) with the group of zones starting at the zone 1 plus the offset value.

Byte 1	**Message number**	**Byte 2**	**Zone number offset (0= start at zone 1)**

Message number: **26h**
Message name: **Partition Status Request**
Message length: **2 Bytes**
Acknowledged: **No**
Description: This request will cause the return of the Partition Status Message (06h) for the partition number that was requested.

Byte 1	**Message number**	**Byte 2**	**Partition number (0= partition 1)**

Message number: **27h**
Message name: **Partitions Snapshot Request**
Message length: **1 Byte**
Acknowledged: **No**
Description: This request will cause the return of the Partitions Snapshot Message (07h) containing all partitions.

Byte 1	**Message number**		

Message number: **28h**
Message name: **System Status Request**
Message length: **1 Byte**
Acknowledged: **No**
Description: This request will cause the return of the System Status Message (08h).

Byte 1	**Message number**		

Message number: **29h**
Message name: **Send X-10 Message**
Message length: **4 Bytes**
Acknowledged: **Yes**
Description: This message will contain information about an X-10 command that should be re-sent on the system bus.

Byte 1	**Message number**	**Byte 3**	**Unit code (0=unit 1)**
Byte 2	**House code (0=house A)**	**Byte 4**	**X-10 function code (**see table at message # 0Ah**)**

Message number: **2Ah**
Message name: **Log Event Request**
Message length: **2 Byte**
Acknowledged: **No**
Description: This request will cause the return of the Log Event Message (0Ah).

Byte 1	**Message number**	**Byte 2**	**Event number requested**

Message number: **2Bh**
Message name: **Send Keypad Text Message**
Message length: **12 Bytes**
Acknowledged: **Yes**
Description: This message will contain ASCII text for a specific keypad on the bus that will be displayed during Terminal Mode.

Byte 1	**Message number**	**Byte 7**	**ASCII character for location +2**
Byte 2	**Keypad address**	**Byte 8**	**ASCII character for location +3**
Byte 3	**Keypad type (0=NX-148e)(all others not supported)**	**Byte 9**	**ASCII character for location +4**
Byte 4	**Display storage location (0=top left corner**	**Byte 10**	**ASCII character for location +5**
Byte 5	**ASCII character for location +0**	**Byte 11**	**ASCII character for location +6**
Byte 6	**ASCII character for location +1**	**Byte 12**	**ASCII character for location +7**

Message number: **2Ch**
Message name: **Keypad Terminal Mode Request**
Message length: **3 Bytes**
Acknowledged: **Yes**
Description: This message will contain the address of a keypad that should enter a Terminal Mode for the time contained. Only one keypad should be in the Terminal Mode at a time.

Byte 1	**Message number**	**Byte 3**	**Number of seconds for Terminal Mode**
Byte 2	**Keypad address**		

Message number: **30h**
Message name: **Program Data Request**
Message length: **4 Bytes**
Acknowledged: **No**
Description: This message will contain a system device's buss address and the logical location of program data that will be returned in a Program Data Reply message (10h).

Byte 1	**Message number**	**Byte 4**	**Bits 0-7 of logical location**
Byte 2	**Device's buss address**		
Byte 3	**Upper logical location / offset**		
Bits 0-3	Bits 8-11 of logical location		
Bits 4,5	Must be 0		
Bit 6	Segment offset (0-none, 1=8 bytes)		
Bit 7	Must be 0		

Message number: **31h**
Message name: **Program Data Command**
Message length: **13 Bytes**
Acknowledged: **Yes**
Description: This message will contain a system device's buss address and the logical location where the included data should be stored.

Byte 1	**Message number**			**Byte 6**	**Data byte 1 to store**
Byte 2	**Device's buss address**			**Byte 7**	**Data byte 2 to store**
Byte 3	**Upper logical location / offset**			**Byte 8**	**Data byte 3 to store**
Bits 0-3	Bits 8-11 of logical location			**Byte 9**	**Data byte 4 to store**
Bit 4	Segment size (0=byte, 1=nibble)			**Byte 10**	**Data byte 5 to store**
Bit 5	Must be 1			**Byte 11**	**Data byte 6 to store**
Bit 6	Segment offset (0-none, 1=8 bytes)			**Byte 12**	**Data byte 7 to store**
Bit 7	Must be 0			**Byte 13**	**Data byte 8 to store**
Byte 4	**Bits 0-7 of logical location**				
Byte 5	**Location length / data type**				
Bits 0-4	Number of segments in location (0=1 segment)				
Bits 5-7	Data type :	2=Hexadecimal	5=unused		
	0=Binary	3=ASCII	6=unused		
	1=Decimal	4=unused	7=unused		

Message number: **32h**
Message name: **User Information Request with PIN**
Message length: **5 Bytes**
Acknowledged: **No**
Description: This message will contain a user number for which information is being requested and a PIN that will be checked for Master capability before proceeding. The information will be returned in a User Information Reply message (12h).

Byte 1	**Message number**	**Byte 4**	**(Master) PIN digits 5 & 6**
Byte 2	**(Master) PIN digits 1 & 2**	Bits 0-3	PIN digit 5 (pad with 0 if 4 digit PIN)
Bits 0-3	PIN digit 1	Bits 4-7	PIN digit 6 (pad with 0 if 4 digit PIN)
Bits 4-7	PIN digit 2	**Byte 5**	**User number** (1=user 1)
Byte 3	**(Master) PIN digits 3 & 4**		
Bits 0-3	PIN digit 3		
Bits 4-7	PIN digit 4		

Message number: **33h**
Message name: **User Information Request without PIN**
Message length: **2 Bytes**
Acknowledged: **No**
Description: This message will contain a user number for which information is being requested, no authentication will be performed. The information will be returned in a User Information Reply message (12h).

Byte 1	**Message number**	**Byte 2**	**User number** (1=user 1)

Message number: **34h**
Message name: **Set User Code Command with PIN**
Message length: **8 Bytes**
Acknowledged: **Yes**
Description: This message will contain all digits that should be stored as the new code for the designated User number. A PIN will be checked for Master capability before proceeding. A successful programming of the user code will result in the User Information Reply (12h) returned in place of the acknowledge.

Byte 1	**Message number**	**Byte 5**	**User number** (1=user 1)
Byte 2	**(Master) PIN digits 1 & 2**	**Byte 6**	**PIN digits 1 & 2**
Bits 0-3	PIN digit 1	Bits 0-3	PIN digit 1
Bits 4-7	PIN digit 2	Bits 4-7	PIN digit 2
Byte 3	**(Master) PIN digits 3 & 4**	**Byte 7**	**PIN digits 3 & 4**
Bits 0-3	PIN digit 3	Bits 0-3	PIN digit 3
Bits 4-7	PIN digit 4	Bits 4-7	PIN digit 4
Byte 4	**(Master) PIN digits 5 & 6**	**Byte 8**	**PIN digits 5 & 6**
Bits 0-3	PIN digit 5 (pad with 0 if 4 digit PIN)	Bits 0-3	PIN digit 5 (pad with 0 if 4 digit PIN)
Bits 4-7	PIN digit 6 (pad with 0 if 4 digit PIN)	Bits 4-7	PIN digit 6 (pad with 0 if 4 digit PIN)

Message number: **35h**
Message name: **Set User Code Command without PIN**
Message length: **5 Bytes**
Acknowledged: **Yes**
Description: This message will contain all digits that should be stored as the new code for the designated User number. No authentication will be performed. A successful programming of the user code will result in the User Information Reply (12h) returned in place of the acknowledge.

Byte 1	**Message number**	**Byte 4**	**PIN digits 3 & 4**
Byte 2	**User number** (1=user 1)	Bits 0-3	PIN digit 3
Byte 3	**PIN digits 1 & 2**	Bits 4-7	PIN digit 4
Bits 0-3	PIN digit 1	**Byte 5**	**PIN digits 5 & 6**
Bits 4-7	PIN digit 2	Bits 0-3	PIN digit 5 (pad with 0 if 4 digit PIN)
		Bits 4-7	PIN digit 6 (pad with 0 if 4 digit PIN)

Message number: **36h**

Message name: **Set User Authorization Command with PIN**

Message length: **7 Bytes**

Acknowledged: **Yes**

Description: This message will contain all attributes and partitions that should be stored as the new information for the designated User number. A PIN will be checked for Master capability before proceeding.

Byte 1	**Message number**	**Byte 6***	**Authority flags** (if bit 7 is clear)
Byte 2	**(Master) PIN digits 1 & 2**	Bit 0	Reserved
Bits 0-3	PIN digit 1	Bit 1	Arm only
Bits 4-7	PIN digit 2	Bit 2	Arm only (during close window)
Byte 3	**(Master) PIN digits 3 & 4**	Bit 3	Master / program
Bits 0-3	PIN digit 3	Bit 4	Arm / disarm
Bits 4-7	PIN digit 4	Bit 5	Bypass enable
Byte 4	**(Master) PIN digits 5 & 6**	Bit 6	Open / close report enable
Bits 0-3	PIN digit 5 (pad with 0 if 4 digit PIN)	Bit 7	Must be a 0
Bits 4-7	PIN digit 6 (pad with 0 if 4 digit PIN)	**Byte 7**	**Authorized partition(s) mask**
Byte 5	**User number** (1=user 1)	Bit 0	Authorized for partition 1
Byte 6*	**Authority flags** (if bit 7 is set)	Bit 1	Authorized for partition 2
Bit 0	Output 1 enable	Bit 2	Authorized for partition 3
Bit 1	Output 2 enable	Bit 3	Authorized for partition 4
Bit 2	Output 3 enable	Bit 4	Authorized for partition 5
Bit 3	Output 4 enable	Bit 5	Authorized for partition 6
Bit 4	Arm / disarm	Bit 6	Authorized for partition 7
Bit 5	Bypass enable	Bit 7	Authorized for partition 8
Bit 6	Open / close report enable		
Bit 7	Must be a 1		

Message number: **37h**

Message name: **Set User Authorization Command without PIN**

Message length: **4 Bytes**

Acknowledged: **Yes**

Description: This message will contain all attributes and partitions that should be stored as the new information for the designated User number. No authentication will be performed.

Byte 1	**Message number**	**Byte 3***	**Authority flags** (if bit 7 is set)
Byte 2	**User number** (1=user 1)	Bit 0	Output 1 enable
Byte 3*	**Authority flags** (if bit 7 is clear)	Bit 1	Output 2 enable
Bit 0	Reserved	Bit 2	Output 3 enable
Bit 1	Arm only	Bit 3	Output 4 enable
Bit 2	Arm only (during close window)	Bit 4	Arm / disarm
Bit 3	Master / program	Bit 5	Bypass enable
Bit 4	Arm / disarm	Bit 6	Open / close report enable
Bit 5	Bypass enable	Bit 7	Must be a 1
Bit 6	Open / close report enable	**Byte 4**	**Authorized partition(s) mask**
Bit 7	Must be a 0	Bit 0	Authorized for partition 1
		Bit 1	Authorized for partition 2
		Bit 2	Authorized for partition 3
		Bit 3	Authorized for partition 4
		Bit 4	Authorized for partition 5
		Bit 5	Authorized for partition 6
		Bit 6	Authorized for partition 7
		Bit 7	Authorized for partition 8

Message number: **3Ah**

Message name: **Store Communication Event Command**

Message length: **6 Bytes**

Acknowledged: **Yes**

Description: This message will submit an event to the control's communication stack for possible transmission over its telephone or alternate communications path.

Byte 1	**Message number**	**Byte 4**	**Zone / User / Device number**
Byte 2	**Partition number** (0=partition 1, if relevant)	**Byte 5**	**Data byte 1**
Byte 3	**Event type**	**Byte 6**	**Data byte 2**
Bits 0-6	See type definitions in message 0Ah		
Bit 7	Non-reporting event if set		

*notes:

If Event Type is not equal to 11h (17), data bytes 1 and 2 are unused.

If Event Type is equal to 11h (17) then:

Partition number
- Bit 0-3: Phone selector group number
- Bit 4-6: Partition
- Bit 7: Set for listen in event

And,

If Format is Contact ID:

Data1
- Bit 0-3: Event code 100's digit
- Bit 4-7: 1 for new event 3 for new restore

Data2
- Bit 0-3: Event code 1's digit
- Bit 0-3: Event code 10's digit

IF SIA DCS:

Data1 Bit 0-7: New event first character

Data2 Bit 0-7: New event second character

Message number: **3Bh**

Message name: **Set Clock / Calendar Command**

Message length: **7 Bytes**

Acknowledged: **Yes**

Description: This message will set the clock / calendar in the system.

Byte 1	**Message number**	**Byte 5**	**Hour** (0-23)
Byte 2	**Year** (00-99)	**Byte 6**	**Minute** (0-59)
Byte 3	**Month** (1-12)	**Byte 7**	**Day of week** (1=Sunday)
Byte 4	**Day** (1-31)		

Message number: **3Ch**

Message name: **Primary Keypad Function with PIN**

Message length: **6 Bytes**

Acknowledged: **Yes**

Description: This message will contain a value that defines with function to perform, the partitions to use and a PIN value for the validation.

Byte 1	**Message number**	**Byte 5**	**Keypad function #** (see table that follows)
Byte 2	**PIN digits 1 & 2**	**Byte 6**	**Partition mask**
Bits 0-3	PIN digit 1	Bit 0	Perform on partition 1 (if PIN has access)
Bits 4-7	PIN digit 2	Bit 1	Perform on partition 2 (if PIN has access)
Byte 3	**PIN digits 3 & 4**	Bit 2	Perform on partition 3 (if PIN has access)
Bits 0-3	PIN digit 3	Bit 3	Perform on partition 4 (if PIN has access)
Bits 4-7	PIN digit 4	Bit 4	Perform on partition 5 (if PIN has access)
Byte 4	**PIN digits 5 & 6**	Bit 5	Perform on partition 6 (if PIN has access)
Bits 0-3	PIN digit 5 (pad with 0 if 4 digit PIN)	Bit 6	Perform on partition 7 (if PIN has access)
Bits 4-7	PIN digit 6 (pad with 0 if 4 digit PIN)	Bit 7	Perform on partition 8 (if PIN has access)

Function #	**Function performed**	**Function #**	**Function performed**
00h	Turn off any sounder or alarm	05h	Initiate auto-arm
01h	Disarm	06h	Start walk-test mode
02h	Arm in away mode	07h	Stop walk-test mode
03h	Arm in stay mode		
04h	Cancel	08h-FFh	Reserved

Message number: **3Dh**

Message name: **Primary Keypad Function without PIN**

Message length: **4 Bytes**

Acknowledged: **Yes**

Description: This message will contain a value that defines with function to perform, the partitions and user number to assign to the function.

Byte 1	**Message number**	**Byte 4**	**User number**
Byte 2	**Keypad function #** (see above table)		
Byte 3	**Partition mask**		
Bit 0	Perform on partition		
Bit 1	Perform on partition 2		
Bit 2	Perform on partition 3		
Bit 3	Perform on partition 4		
Bit 4	Perform on partition 5		
Bit 5	Perform on partition 6		
Bit 6	Perform on partition 7		
Bit 7	Perform on partition 8		

Message number: **3Eh**
Message name: **Secondary Keypad Function**
Message length: **3 Bytes**
Acknowledged: **Yes**
Description: This message will contain a value that defines with function to perform, and the partitions to use.

Byte 1	**Message number**		
Byte 2	**Keypad function # (**see table that follows**)**		
Byte 3	**Partition mask**		
Bit 0	Perform on partition 1		
Bit 1	Perform on partition 2		
Bit 2	Perform on partition 3		
Bit 3	Perform on partition 4		
Bit 4	Perform on partition 5		
Bit 5	Perform on partition 6		
Bit 6	Perform on partition 7		
Bit 7	Perform on partition 8		

Function #	Function performed	Function #	Function performed
00h	Stay (1 button arm / toggle interiors)	0Ah	Enable silent exit (for this arm cycle)
01h	Chime (toggle chime mode)	0Bh	Perform test
02h	Exit (1 button arm / toggle instant)	0Ch	Group bypass
03h	Bypass interiors	0Dh	Auxiliary function 1
04h	Fire panic	0Eh	Auxiliary function 2
05h	Medical panic	0Fh	Start keypad sounder
06h	Police panic		
07h	Smoke detector reset		
08h	Auto callback download		
09h	Manual pickup download	10h-FFh	Reserved

Message number: **3Fh**
Message name: **Zone Bypass Toggle**
Message length: **2 Bytes**
Acknowledged: **Yes**
Description: This message will contain a number of a zone that should be (un)bypassed.

Byte 1	**Message number**	**Byte 2**	**Zone number (0= zone 1)**
